Multi-component kit for fixing purposes and its use

A multi-component kit for a curable composition for fixing purposes, comprising an
epoxy component (a), which comprises curable epoxides, and a hardener component
10 (b), which comprises a Mannich base formulation, and the use of Mannich base
formulations and, especially, further additives in hardener components for epoxy
resins, the Mannich base formulation having specific properties (viscosity, H equi-
valents, content of free phenol derivatives). The multi-component kits according to the
invention can be used within a broad temperature range and enable mortar
15 compositions to be produced which, after curing, exhibit a particularly large tolerance
range for temperatures and exhibit particularly high bond stress values at low
temperatures and, especially, also at high temperatures.
